Lecture 1.2 **Evolutionary Models** Simon Ho

Popular phylogenetic methods

- 1. Maximum parsimony
- 2. Distance-based methods
- 3. Maximum likelihood
- 4. Bayesian inference

Model-based methods

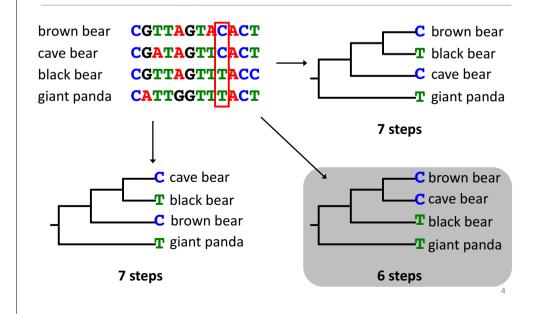

Maximum parsimony

Maximum Parsimony

Maximum parsimony

- Identifies the tree topology that can explain the sequence data, using the smallest number of inferred substitution events
- · Commonly used for morphological data
- · Now rarely used for analysing genetic data
 - Cannot estimate evolutionary rates or timescales
 - Effects of multiple substitutions

Observed substitutions

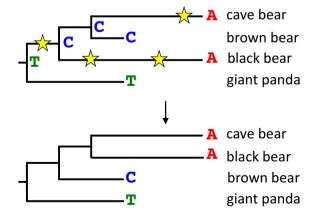

Actual substitutions

- Maximum parsimony does not correct for multiple substitutions at the same site
- This leads to a problem known as long-branch attraction
 - Long branch = many substitutions
 - · Similarities arise by chance
 - · Long branches cluster together

5

Long-branch attraction

We can correct for multiple hits using substitution models

Substitution Models

/

Nucleotide substitution models

Rate Matrix

Base Frequencies

$$\pi_A + \pi_C + \pi_G + \pi_T = 1$$

JC

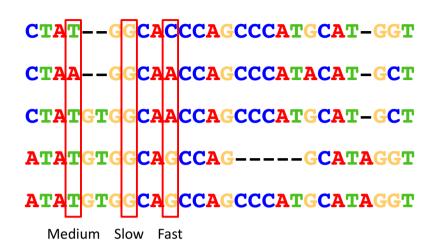

HKY

GTR

a=b=c=d=e=f $\pi_A=\pi_C=\pi_G=\pi_T$ a=c=d=f, b=e π_A , π_C , π_G , π_T a, b, c, d, e, f π_A , π_C , π_G , π_T

9

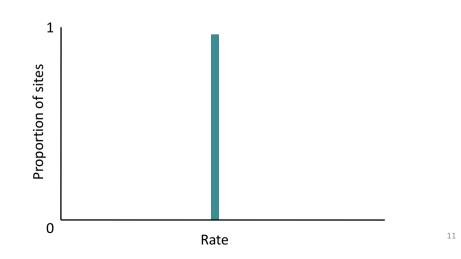

Rate variation across sites

10

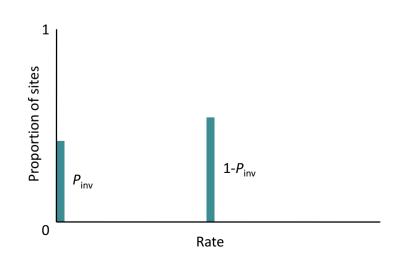

Rate variation across sites

• Equal rates among sites

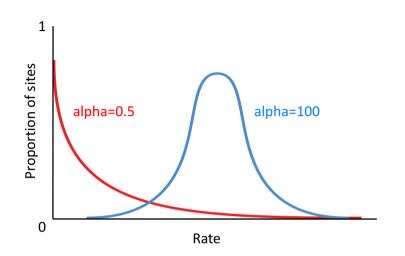

Rate variation across sites

• Proportion of invariable sites (+I models)

Rate variation across sites

• Gamma-distributed rate variation across sites (+G models)

Nucleotide substitution models

Rate Matrix Base Frequencies

Site Rates

$$\begin{array}{ccc}
A & \stackrel{b}{\longleftrightarrow} G \\
 & \downarrow & \downarrow & \downarrow \\
C & \longleftarrow & T
\end{array}$$

$$\pi_A + \pi_C + \pi_G + \pi_T = 1$$
 + I + G

$\label{eq:JC} \begin{aligned} & \textbf{JC} \\ & \textbf{a=b=c=d=e=f} \\ & \pi_{\textbf{A}} = \pi_{\textbf{C}} = \pi_{\textbf{G}} = \pi_{\textbf{T}} \end{aligned}$

HKY
$$a=c=d=f, b=e$$
 $\pi_A, \pi_C, \pi_G, \pi_T$

GTR
a, b, c, d, e, f
$$\pi_A$$
, π_C , π_G , π_T

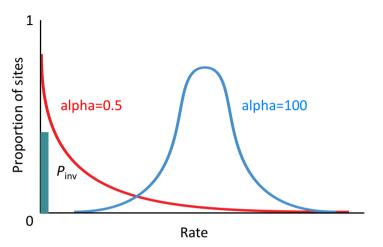

$$\begin{aligned} \textbf{GTR+I+G} \\ \textbf{a, b, c, d, e, f} \\ \pi_{\textbf{A}}, \pi_{\textbf{C}}, \pi_{\textbf{G}}, \pi_{\textbf{T}} \\ \textbf{I, G} \end{aligned}$$

15

13

Rate variation among sites

• Gamma-distributed rate variation across sites and a proportion of invariable sites (+G+I models)

Nucleotide substitution models

Rate Matrix B

Base Frequencies

Site Rates

+ I + G

$$\pi_A + \pi_C + \pi_G + \pi_T = 1$$

#Models

203

X

4

= 12,180

In phylogenetics, we typically consider a small subset of these

15

16

Proportion of invariable sites

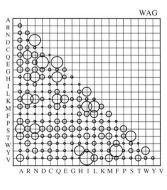

- · Often overestimated in analyses of intraspecific data
- · Unable to distinguish between:
 - · Sites that are invariable and unable to change
 - Sites that are constant and by chance have not mutated
- · Not biologically meaningful
- Slowly evolving sites taken into account by +G

Use +G models to account for rate variation across sites

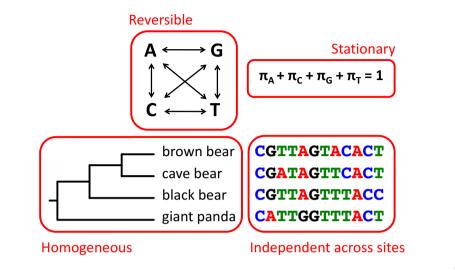

17

Amino acid substitution matrices

- 20x20 matrix of substitution probabilities
- Too many parameters to estimate
 - GTR model for DNA: 6 parameters
 - · GTR model for proteins: 190 parameters
- Estimate substitution probabilities using large data set
 - PAM
 - BLOSUM
 - JTT
 - WAG

Fundamental assumptions

Model Selection

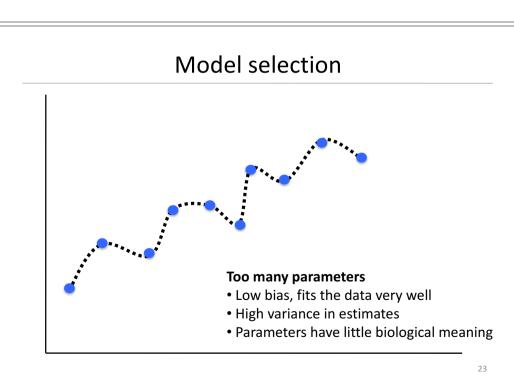

Model selection

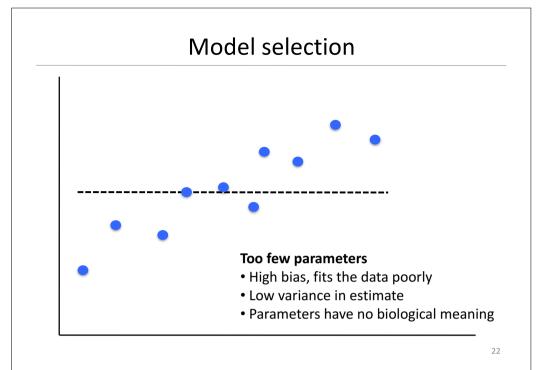

1. Subjective model selection

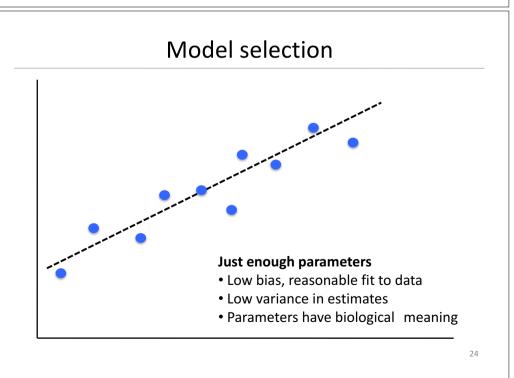

- Pick a model that seems sensible
- Balance the number of parameters against the amount of data
- Biological motivation

2. Objective model selection

- Use information theory and let a computer do it for you
- Statistical motivation

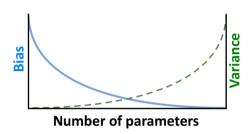

Model selection

- Adding more parameters always improves the fit of the model to the observed data
- But more parameters leads to greater variance in the estimates of those parameters

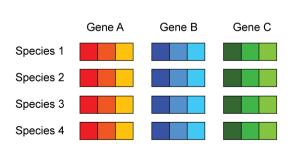

Is the improvement in likelihood worth the cost of adding a parameter?

25

Data partitioning

• Separate substitution model for each gene and codon position?

- Biological
 - Genome
 - Genes
 - Codon positions
 - RNA stems vs loops
 - Hydrophobic vs hydrophilic
- Statistical

Model selection

- Likelihood-ratio test (LRT)
 Used to compare nested models
- Akaike information criterion (AIC)
 AIC = -2ln(likelihood) + 2k
- Bayesian information criterion (BIC)
 BIC = -2ln(likelihood) + kln(n)

26

PartitionFinder

- Too many possible partitioning schemes
 - 15 schemes for 4 genes
 - 52 schemes for 5 genes
 - 203 schemes for 6 genes

PartitionFinder: Combined Selection of Partitioning Schemes and Substitution Models for Phylogenetic Analyses

Robert Lanfear,*,1 Brett Calcott, 1,2 Simon Y. W. Ho,3 and Stephane Guindon4

2012 - Molecular Biology and Evolution, 29: 1695-1701.

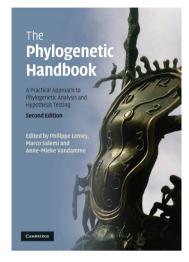

28

Substitution models in practice

- Phylogenetic estimates are usually robust to choice of model
- **GTR+G** is fine for most data sets
- Sensible data partitioning (e.g., by codon position)
